Important Disclaimers:

The work presented in this document was carried out in accordance with the Renzo Tonin & Associates Quality Assurance System, which is based on Australian/New Zealand Standard AS/NZS ISO 9001.

This document is issued subject to review and authorisation by the suitably qualified and experienced person named in the last column above. If no name appears, this document shall be considered as preliminary or draft only and no reliance shall be placed upon it other than for information to be verified later.

This document is prepared for the particular requirements of our Client referred to above in the 'Document details' which are based on a specific brief with limitations as agreed to with the Client. It is not intended for and should not be relied upon by a third party and no responsibility is undertaken to any third party without prior consent provided by Renzo Tonin & Associates. The information herein should not be reproduced, presented or reviewed except in full. Prior to passing on to a third party, the Client is to fully inform the third party of the specific brief and limitations associated with the commission.

In preparing this report, we have relied upon, and presumed accurate, any information (or confirmation of the absence thereof) provided by the Client and/or from other sources. Except as otherwise stated in the report, we have not attempted to verify the accuracy or completeness of any such information. If the information is subsequently determined to be false, inaccurate or incomplete then it is possible that our observations and conclusions as expressed in this report may change.

We have derived data in this report from information sourced from the Client (if any) and/or available in the public domain at the time or times outlined in this report. The passage of time, manifestation of latent conditions or impacts of future events may require further examination and re-evaluation of the data, findings, observations and conclusions expressed in this report.

We have prepared this report in accordance with the usual care and thoroughness of the consulting profession, for the sole purpose described above and by reference to applicable standards, guidelines, procedures and practices at the date of issue of this report. For the reasons outlined above, however, no other warranty or guarantee, whether expressed or implied, is made as to the data, observations and findings expressed in this report, to the extent permitted by law.

The information contained herein is for the purpose of acoustics only. No claims are made and no liability is accepted in respect of design and construction issues falling outside of the specialist field of acoustics engineering including and not limited to structural integrity, fire rating, architectural buildability and fit-for-purpose, waterproofing and the like. Supplementary professional advice should be sought in respect of these issues.

External cladding disclaimer: No claims are made and no liability is accepted in respect of any external wall and/or roof systems (eg facade / cladding materials, insulation etc) that are: (a) not compliant with or do not conform to any relevant non-acoustic legislation, regulation, standard, instructions or Building Codes; or (b) installed, applied, specified or utilised in such a manner that is not compliant with or does not conform to any relevant non-acoustic legislation, regulation, standard, instructions or Building Codes.

Executive summary

Renzo Tonin & Associates undertook an acoustic assessment of the proposed paint recovery plant to be located at 2-44 Grainger Road, West Footscray (the Subject Facility), to assess noise from commercial operations.

We have been briefed by Davis Advisory to consider acoustics in relation to the proposed Paint Circular Economy HQ (PaCE HQ) project in West Footscray. The PaCE HQ project is described in Annexure D of the application, and our comments and findings are referrable to that project.

In conducting the acoustic assessment, Renzo Tonin & Associates has:

- Quantified relevant noise criteria: EPA 1826-P1 'Noise Protocol'
- Measured noise levels from operational activities and associated mechanical equipment at similar industrial facilities
- Analysed the noise monitoring and measurements
- Constructed a three-dimensional noise model of the Subject Facility, to assess various noise impacts (described below)
- Assessed and compared predicted levels to noise limits.

The outcomes of the acoustic assessment are:

- Noise levels from the representative mechanical services were found to conform at all times with EPA 1826-P1 'Noise Protocol' limits.
- Noise levels from anticipated delivery activities were found to conform at all times with EPA 1826-P1 limits.
- Noise levels from the warehouse/plant operations were found to conform at all times with EPA 1826-P1 limits, with the specific construction requirements detailed in Section 6.3.1.2. The specific construction requirements include wall and ceiling treatments to the warehouse. Such treatments are commonplace, and application is straight forward to design, during the design stage when more detailed information is available.

Based on the above, the PaCE HQ project is expected to conform with all nominated criteria, and on this basis, not unreasonably affect noise amenity in the area.

1 Introduction

Renzo Tonin & Associates undertook an acoustic assessment of the proposed paint recovery plant to be located at 2-44 Grainger Road, West Footscray (the Subject Facility), to assess noise from commercial operations.

We have been briefed by DA to consider Acoustics in relation to the proposed PaCE HQ project in West Footscray. The PaCE HQ project is described in Annexure D of the application, and our comments and findings are referrable to that project.

The acoustic assessment has been based on drawings (detailed within this assessment) and information provided by the client.

The work documented in this report was carried out in accordance with the Renzo Tonin & Associates Quality Assurance System, which is based on Australian Standard / NZS ISO 9001. Appendix A contains a glossary of acoustic terms used in this report.

2 Site overview

The Subject Facility is proposing operate Monday to Saturday from 7am to 6pm. Figure 1 and Table 1 present an overview of the Subject Facility surrounding land uses.

Table 1: Existing land uses surrounding the Subject Facility

Subject Facility	2-44 Grainger Road, West Footscray
	Industrial 1 Zone (IN1Z) & Industrial 3 Zone (1N3Z)
North of the Subject Facility	Rail corridor
	18 Newman Drive, Footscray
	General Residential Zone -Schedule 1 (GRZ1)
	 Residential building approximately 120 metres from the Subject Facility's existing northern boundary, across rail corridor
East of the Subject Facility	268 Geelong Road, West Footscray
	Industrial 1 Zone (IN1Z)
	Fenner Conveyors – Industrial equipment supplier
South of the Subject Facility	46 Grainger Road, West Footscray
	Industrial 3 Zone (IN3Z)
	Mixed commercial showrooms / warehouses
	R1 - 2 Robbs Road, West Footscray
	Industrial 3 Zone (IN3Z)
	Residential building facade approximately 30 metres from the Subject Facility
	R3 - 4 Robbs Road, West Footscray
	Industrial 3 Zone (IN3Z)
	Residential building facade approximately 40 metres from the Subject Facility
	R5 - 5 Hansen Street, West Footscray
	General Residential Zone -Schedule 1 (GRZ1)
	Residential building facade approximately 90 metres from the Subject Facility
West of the Subject Facility	11 Braid Street, West Footscray
	Industrial 3 Zone (IN3Z)
	Keables P/L – Fastener supplier
	R2 - 1 Robbs Road, West Footscray
	General Residential Zone -Schedule 1 (GRZ1)
	Residential building facade approximately 75 metres from the Subject Facility
	R4 - 3 Robbs Road, West Footscray
	General Residential Zone -Schedule 1 (GRZ1)
	Residential building façade approximately 80 metres from the Subject Facility
	R6 – 17 Braid Street, West Footscray
	General Residential Zone -Schedule 1 (GRZ1)

Figure 1: Subject Site and Facility & surrounding unattended monitoring and attended measurement locations

3 Noise measurements

3.1 Unattended long-term noise monitoring

To quantify the existing noise levels in the area, Renzo Tonin & Associates conducted unattended noise monitoring as detailed below. We conducted door knocking, to seek permission to place the monitoring equipment within the private property (as a safe and secure location) for the duration, with both residents happy to provide access.

The monitor locations (L1 & L2) are shown in Figure 1 and described in Table 2 below. APPENDIX B presents graphs of the unattended monitored noise levels at each location.

Table 2: Noise monitoring locations

ID	Location	Details
L1	1 Robbs Road- Representative of the most affected residential receiver (at 2 Robbs Road) – Approximately 70m SSW from the front fence to rear boundary facade of Subject Facility	 Monitoring period: Thursday 6th October to Thursday 13th October 2022 The microphone was set up 1.5 metres above ground level in the front yard, 3.5m in front of the bedroom window Generally low wind and limited precipitation for the duration of the monitoring The noise environment was dominated by traffic noise on Geelong Road
L2	4 Hansen Street (background measurement location) – Approximately 140m SW from the rear fence of Subject Facility with dwellings in between.	 Monitoring period: Thursday 6th October to Thursday 13th October 2022 The microphone was set up 1.5 metres above ground level, set up such that topography blocked line of sight to the Subject Facility & other noise generating industry within the surrounding area Generally low wind and limited precipitation for the duration of the monitoring The noise environment was dominated by local wildlife and distant traffic on Geelong Road

Notes:

- 1. The monitors were set to record broadband and spectral noise descriptors, and audio for noise source verification
- 2. Weather data per Bureau of Meteorology's Laverton RAAF weather station.

Table 3 presents background noise levels relevant for derivation of noise limits.

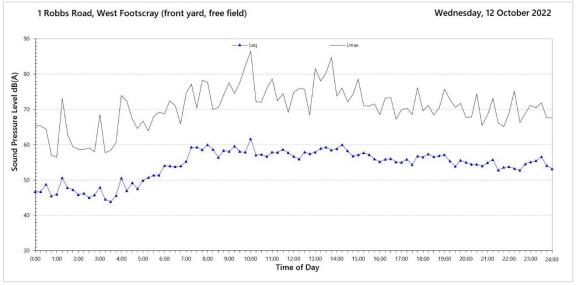

Table 3: Period average background noise levels

ID Las	ocation		Represe	Representative period background noise level, L ₉₀ dB(A)		
ID Loc	ation		Day	Evening	Night	
L1 1 R	obbs Road, W	/est Footscray	49	47	44	
L2 4 H	ansen Street,	West Footscray	44	42	40	
EPA 1826	Day:	Monday-to-Saturday 7a	am-to-6pm;	Sundays N/A		
Period	Evening:	Monday-to-Saturday 6	pm-to-10pm;	Sundays 7am-to-10pm		
Definitions	s: Night:	All days 10pm-to-7am				
Notes:	NTI XL2 Class 1 noise monitors were used for the campaign. The calibration of the device was checked in the field					

NTI XL2 Class 1 noise monitors were used for the campaign. The calibration of the device was checked in the field immediately before and after the measurement using a Brüel & Kjær Type 4231 calibrator; no drift in calibration was observed. The noise monitors conform with IEC 61672-1:2013 and IEC 61260-1:2014; the sound calibrator conforms with IEC 60942:2017, and all carry manufacturers certification or NATA certification detailing Standard conformance testing within the last two years and one year respectively.

Figure 2 shows an example daily profile of existing noise levels in the area at Location L1 (1 Robbs Road), which may be compared to predicted noise levels discussed in later sections of this report. APPENDIX B presents full noise profiles for each day of logging.

Figure 2: Example daily profile of existing noise levels in area

Note: APPENDIX B presents full noise profiles for each day of logging.

3.2 Offsite attended short-term noise measurements

To assist with identifying the existing noise sources in the area, Renzo Tonin & Associates conducted attended noise measurements on Thursday 6th October 2022 between 10:30am and 12:00pm. The measurement locations (A1 & A2) are shown in Figure 1 and described in Table 4 below.

These measurements have been conducted to provide a greater understanding of the surrounding environment and the potential impacts on the nearby residents to the Subject Facility. In this way, these measurements have confirmed that the noise levels recorded at the unattended monitoring location (L1) are not impacted by noise sources (i.e. industrial facilities within the area).

Table 4: Offsite noise measurement locations

ID	Location	Measurement Details ¹
A1	Corner of Grainger &	 Conducted on Thursday 6th October 2022 between 10:30am & 12pm Measured noise level of 69 L_{eq} dB(A) and 59 L₉₀ dB(A)
	Geelong Road	 The microphone was set up 1.5 metres above ground level The noise environment was dominated by traffic on Geelong Road
A2	Front of 17 Braid St, West Footscray	 Conducted on Thursday 6thOctober 2022 between 10:30am & 12pm Measured noise level of 59 L_{eq} dB(A) and 55 L₉₀ dB(A) The microphone was set up 1.5 metres above ground level The noise environment was dominated by local traffic & distant traffic on Geelong Road

Notes:

- 1. Measurements were set to record broadband and spectral noise descriptors, and audio for noise source verification
- 2. NTi XL2 sound level analysers were used for the measurement campaigns. The XL2 is a Class 1 instrument having accuracy suitable for field and laboratory use. The calibration of the device was checked in the field immediately before and after the measurement using a Brüel & Kjær Type 4231 calibrator; no drift in calibration was observed. The noise monitors conform with IEC 61672-1:2013 and IEC 61260-1:2014; the sound calibrator conforms with IEC 60942:2017, and; all carry manufacturers certification or NATA certification detailing Standard conformance testing within the last two years and one year respectively.

4 Noise sources

Renzo Tonin & Associates has used the following noise sources levels in our assessment. These levels are from measurements and database levels as provided by the client.

Table 5: Specific internal warehouse equipment/activity noise levels

Item	Equipment/activity	Noise level L _{,eq} dB(A)
1	Bin Conveyor	75 dB(A) at 1m
2	Solvent RUNI Screw Compactor	100 dB(A) at 1m ⁽ⁱ⁾
3	Inclined Auger (Solvent Based)	75 dB(A) at 1m
4	Inclined Auger (Water Based)	75 dB(A) at 1m
5	RUNI Screw Compactor	100 dB(A) at 1m ⁽ⁱ⁾
6	Inclined Conveyor	75 dB(A) at 1m
7	Force Quad Shaft Shredder	76 dB(A) at 1m
8	Dewatering Screen 1	92 dB(A) at 1m
9	Dewatering Screen 2	92 dB(A) at 1m
10	Inclined Conveyor	75 dB(A) at 1m
11	Over-band Magnet Separator	50 dB(A) at 1m
12	Bi-Directional Conveyor	75 dB(A) at 1m
13	Inclined conveyor	75 dB(A) at 1m
14	Float Sink tank	80 dB(A) at 1m
15	Dewatering Auger	80 dB(A) at 1m
16	Granulator	105 dB(A) at 1m ⁽ⁱ⁾
17	Friction Washer	105 dB(A) at 1m ⁽ⁱ⁾
18	Horizontal Auger	75 dB(A) at 1m
19	Mechanical Dryer	110 dB(A) at 1m ^(t)
20	Blower	110 dB(A) at 1m ^(t)
21	Pre cleaner and Metal Detector	90 dB(A) at 1m
22	Blower	110 dB(A) at 1m ^(t)
23	Double Bagging Station	110 dB(A) at 1m ^(t)

Note (t) Where identified with (t), a 5dB 'tonality' adjustment has been applied, consistent with observed operational noise levels

Further to the above, ventilation equipment is understood to be required for the proposed operations. The following is understood to be the representative of the equipment that will be required. The noise levels have been taken from manufacturer technical data sheets.

⁽i) Where identified with (i), a 5dB 'impulsiveness' adjustment has been applied, consistent with observed operational noise levels

All equipment/activity source levels are provided as broadband sound pressure levels at distance. Note that 1/3 octave band sound pressure levels (derived from these sound pressure levels at distance) have been used in this assessment.

Table 6: Ventilation equipment/activity noise levels

Description	Inlet noise level L _{eq} dB(A)
Supply fan – (x2) Fantech AP0714KP (operating continuously)	69 dB(A) at 3m
Exhaust fan – (x2) Fantech AP0804KE (operating continuously)	69 dB(A) at 3m
Runi exhaust fan – (x2) Fantech AP0404AE (operating continuously)	56 dB(A) at 3m

Table 7: Typical equipment/activity noise levels

Description	Noise level L _{eq} dB(A)
Outdoor air conditioner cassette (5 units assumed)	65 dB(A) at 1 metre
Forklift movement (continuous)	64 dB(A) at 5m
Small-scale exhaust fan (e.g. toilet, 5 units assumed)	57 dB(A) at 0.5 metres

5 Criteria

5.1 EPA 1826-P1 commercial noise limits

Within the Melbourne metropolitan region, noise from commercial plant and activities affecting residential properties is governed by the Victorian Part 1 of EPA Publication 1826 'Noise Limit and Assessment Protocol for the Control of Noise from Commercial, Industrial and Trade Premises and Entertainment Venues' (1826-P1), legislated by way of the Environment Protection Act 2017 (VIC); to protect beneficial domestic uses, in particular sleep during the night period.

EPA 1826-P1 noise limits are calculated from zoning and background noise levels measured within an area, in absence of intrusive commercial noise sources. Table 8 presents the applicable noise limits which have been calculated in accordance with the EPA 1826-P1.

Table 8: EPA 1826-P1 noise limits

Period	Zor	ning level, L	eq dB(A)	Background L ₉₀ dB(A)	Background classification	EPA 1826-P1 limit L _{eq} dB(A)
1 Robbs	1 Robbs Road, West Footscray					
Day	55			49	High Background	55
Evening	49			47	High Background	50
Night	44			44	High Background	47
4 Hanse	n Str	eet, West F	ootscray			
Day	52			44	Neutral	52
Evening	46			42	Neutral	46
Night	41			40	High Background	43
EPA 1826		Day:	Monday-to	-Saturday 7am-to-6pm;	Sundays N/A	
Period Definition:	ic.	Evening:	Monday-to	-Saturday 6pm-to-10pm;	Sundays 7am-to-10pm	
Demillion	13.	Night:	All days 10p	om-to-7am		

Notes: Background noise levels from L1 have been used for sensitive receivers that are directly affected by traffic noise from Geelong Road, while background noise levels from L2 have been used for all sensitive receivers that are shielded from traffic noise from Geelong Road.

EPA 1826-P1 noise limits are calculated from zoning and background noise levels measured within an area, in absence of intrusive commercial noise sources.

In addition, where applicable, the effective noise level is determined, for noise from commercial, industrial and trade premises, as a 30-min equivalent sound pressure level $L_{Aeq,30min}$ adjusted, where relevant for:

```
a. duration (A<sub>dur</sub>)
b. Noise character
i. tonality (A<sub>tone</sub>) ii. impulse (A<sub>imp</sub>) iii. intermittency (A<sub>int</sub>)

Measurement position
i. reflection (A<sub>refl</sub>) ii. indoor (A<sub>ind</sub>)
```

The Effective Noise Level (ENL) is calculated using the following equation:

```
ENL = L_{Aeq} + (A_{dur}) + (A_{tone}) + (A_{imp}) + (A_{int}) + (A_{refi}) + (A_{ind})
```

6 Noise assessment

6.1 Internal reverberant noise build-up model (Odeon version 15)

An Odeon three-dimensional noise model, implementing the 'reflection-based scattering' method was built to calculate internal reverberant noise build-up within the Warehouse (Subject Facility) to provide detailed spectral information that was used to inform the Cadna-A environmental noise propagation model. The following inputs were included in the predictive model:

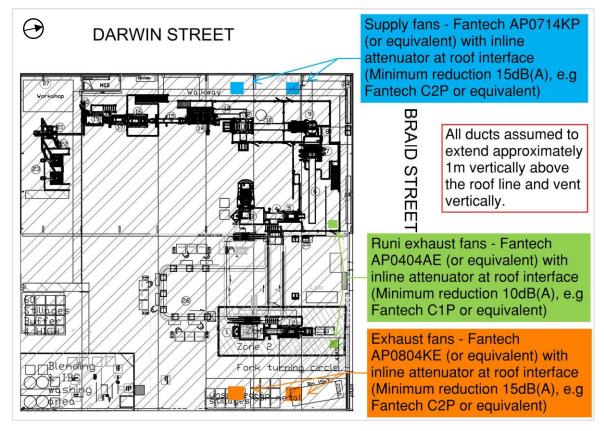

- Source locations were mapped using the layout shown in Table 5 and Figure 5.
- Source levels were inputted as 1/1 octave band sound power levels (from 1/3 octave band sound pressure levels)
- Receiver points were chosen along the periphery (i.e. walls and ceiling) throughout the warehouse.
- Warehouse construction materials:
 - Absorption coefficients are 1/1 octave band levels and based on materials detailed in 6.3.1.1 and 6.3.1.2.
 - Scattering coefficients for all materials set to 0.01 (considered conservative)
- 'Precision' calculation methodology (in accordance with ISO 3382-2:2008)

6.2 Noise propagation model (Cadna-A version 2023)

A Cadna-A three-dimensional noise model, implementing ISO 9613 noise propagation algorithms was built to calculate noise propagation from the Subject Facility to the nearest residential dwellings. The following propagation effects were included in the predictive model:

- Indicative locations of rooftop ventilation penetrations are shown in Table 6 and Figure 3.
 Mitigation of noise with distance, including geometrical spreading and air absorption (20°C, 70% RH & 3m/s wind)
- Reflections from buildings and environment (3 orders of reflection where used.)
- Barrier effects due to obstructions between noise sources and residential receivers
- Ground absorption effects (G= 0.25 was used, where G=0 is fully reflective and G=1 is fully absorptive)
- Local topographical changes (1-5m elevation contours taken from Datashare Vic, as open source data)

Figure 3: Required warehouse construction markup

6.3 Commercial noise assessment

6.3.1 Operational modelling scenarios and assumptions

Renzo Tonin & Associates have provided two scenarios, including a limited operations '**4-Day**' scenario, and a full capacity operations '**Busy Day**' scenario. The noise source locations are provided in Figure 5.

It is understood that the actual day-to-day operations are likely to be less intensive, however, to ensure the assessment is undertaken with a conservative approach (i.e. worst case), in accordance with EPA Pub. 1826 'Noise Protocol', Renzo Tonin assumes that during any 30-minute period, the follow noise sources and activities could occur.

'4-Day' scenario

- 1 x truck delivery to warehouse (semitrailer arrives, idles whilst unloading, leaves) (continuously over 30-minute period)
- 1 x truck collection in carpark (semitrailer arrives, idles whilst loading, leaves) (continuously over 30-minute period)
- 1 x forklift use (moving between warehouses) (continuously over 30-minute period)
- Warehouse / plant & equipment operations at <u>limited</u> capacity (only Item 1 to Item 12 from Table 5 operating) (continuously over 30-minute period)
- All mechanical equipment (i.e. Rooftop Ventilation equipment, AC's, toilet exhausts) operating at full capacity (continuously over 30-minute period)

'Busy Day' scenario

- 1 x truck delivery to warehouse (semitrailer arrives, idles whilst unloading, leaves) (continuously over 30-minute period)
- 1 x truck collection in carpark (semitrailer arrives, idles whilst loading, leaves) (continuously over 30-minute period)
- 1 x forklift use (moving between warehouses) (continuously over 30-minute period)
- Warehouse / plant & equipment operations at <u>full</u> capacity (all Items from Table 5 operating) (continuously over 30-minute period)
- All mechanical equipment (i.e. Rooftop Ventilation equipment, AC's, toilet exhausts) operating at full capacity (continuously over 30-minute period)

6.3.1.1 Existing warehouse construction

The following assumptions have been made with respect to the existing warehouse construction:

- Roller doors on the northern façade of the warehouse remain fully open (continuously open during any 30-minute period of the day for assessment purposes. This is considered worst case)(Note, typically this will only be used once per week for skip collection, otherwise they will remain closed).
- Roller door on the eastern façade of the warehouse remain fully open (continuously open during any 30-minute period of the day for assessment purposes. This is considered worst case)(Note, typically this will only be open when a forklift is entering or existing, otherwise they will remain closed).
- Roller door on the southern and western façade of the warehouse remain closed at all times, and will be permanently covered with [x2] layers of minimum 9mm FC sheeting (green section, see Figure 4).
- All warehouse windows are closed.
- Existing building construction material expected performance:

Metal clad roofing	Minimum 0.55mm BMT	R _{'w} 17
Metal clad walls	Minimum 0.55mm BMT	R _{'w} 17
Roller doors	Steel roller door with sealed gaps to prevent air flow	R _{'w} 15
Reinforced glass windows	10mm wire reinforced glass	R _{'w} 20

6.3.1.2 Required warehouse construction

Further to the above, initial acoustic modelling predictions indicate that additional acoustic attenuation is required. The follow assumptions have been made with respect to the minimum warehouse construction requirements:

Figure 4: Required warehouse construction markup

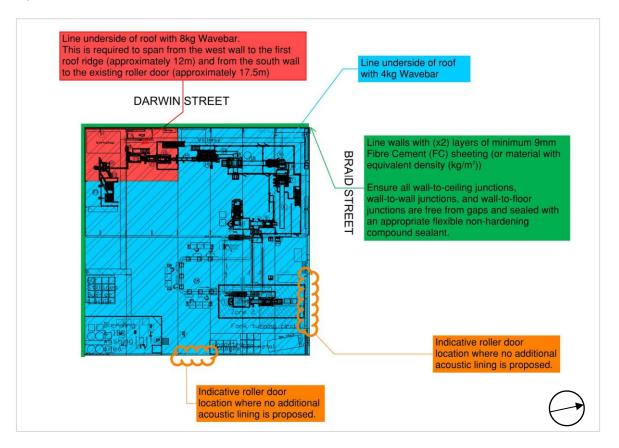

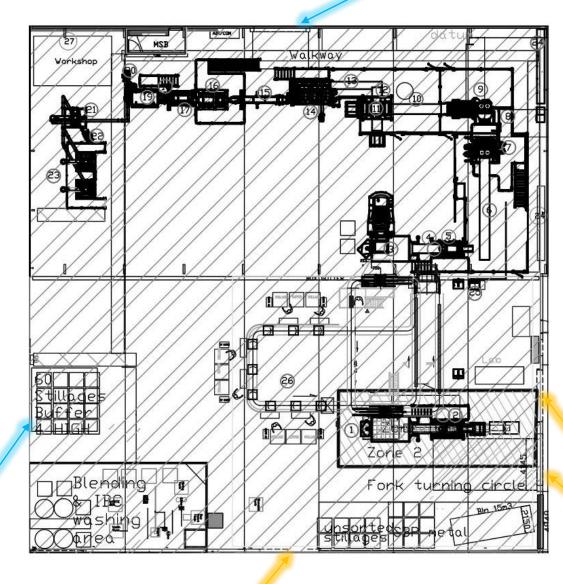

Figure 5: Main Processing Plant Warehouse Layout and sound source locations

Existing Roller Door not to be used. To always remain closed. Shall be closed off with 2x9mm FC sheeting per Figure 4.

Approximate direction of the most affected residential receiver (**R1**), located at 2 Robbs Road.

18	Horizontal Auger	75 dB(A) at 1m
19	Mechanical Dryer	110 dB(A) at 1m ^(t)
20	Blower	110 dB(A) at 1m ^(t)
21	Pre cleaner and Metal Detector	90 dB(A) at 1m
22	Blower	110 dB(A) at 1m ^(t)
23	Double Bagging Station	110 dB(A) at 1m ^(t)

Existing Roller Door not to be used. To always remain closed. Shall be closed off with 2x9mm FC sheeting per Figure 3.

Roller door on the eastern façade of the warehouse remain fully open (continuously open during any 30-minute period of the day for assessment purposes. This is considered worst case)(Note, typically this will only be open when a forklift is entering or existing, otherwise they will remain closed).

Roller doors on the northern façade of the warehouse remain fully open (continuously open during any 30-minute period of the day for assessment purposes. This is considered worst case)(Note, typically this will only be used once per week for skip collection, otherwise they will remain closed).

Figure 6: Proposed General Site Layout and sound source locations

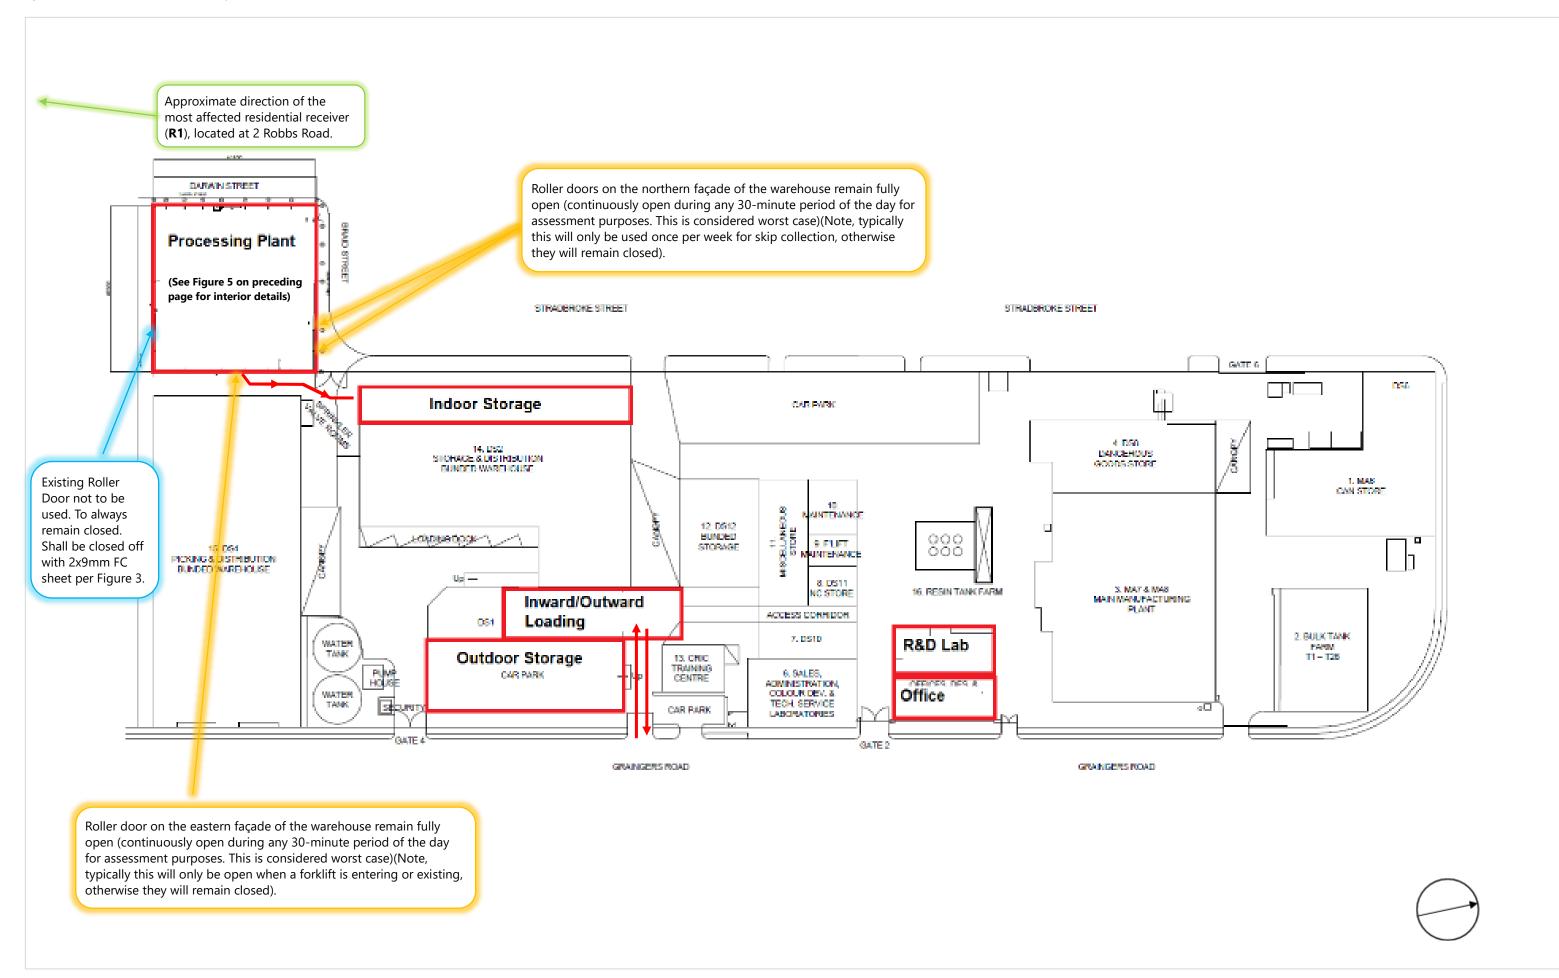

Table 9: Commercial noise assessment

Receiver ID, dwelling location and noise source(s)/activities ^{1,2}	Predicted Effective nois L _{eq} dB(A), Day ³	se level (ENL) at dwelling,	Complies with EPA 1826-P1? Day
R1 – 2 Robbs Road, West Footscray	'4-Day' scenario	'Busy Day' scenario	55 dB(A)
Warehouse / plant & equipment operations	43	50	√ / √
Truck deliveries, forklift use & carpark activities	36	36	√ / √
All mechanical services	26	26	√ /√
Cumulative noise level	43	50	√ /√
R2 – 1 Robbs Road, West Footscray	'4-Day' scenario	'Busy Day' scenario	55 dB(A)
Warehouse / plant & equipment operations	37	44	√ /√
Truck deliveries, forklift use & carpark activities	33	33	√ /√
All mechanical services	21	21	√ /√
Cumulative noise level	38	44	√ /√
R3 – 4 Robbs Road, West Footscray	'4-Day' scenario	'Busy Day' scenario	55 dB(A)
Warehouse / plant & equipment operations	38	46	√ /√
Fruck deliveries, forklift use & carpark activities	33	33	√ / √
All mechanical services	22	22	√ / √
Cumulative noise level	39	46	√ /√
R4 – 3 Robbs Road, West Footscray	'4-Day' scenario	'Busy Day' scenario	55 dB(A)
Warehouse / plant & equipment operations	35	43	√ /√
Fruck deliveries, forklift use & carpark activities	32	32	√ / √
All mechanical services	21	21	√ / √
Cumulative noise level	37	43	√ /√
R5 – 5 Hansen Street, West Footscray	'4-Day' scenario	'Busy Day' scenario	55 dB(A)
Warehouse / plant & equipment operations	33	41	√ /√
Truck deliveries, forklift use & carpark activities	35	35	√ / √
All mechanical services	20	20	√ / √
Cumulative noise level	37	42	√ /√
R6 – 17 Braid St, West Footscray	'4-Day' scenario	'Busy Day' scenario	55 dB(A)
Varehouse / plant & equipment operations	36	44	√ / √
Fruck deliveries, forklift use & carpark activities	42	42	√ / √
All mechanical services	32	32	√ / √
Cumulative noise level	43	46	√ / √

Note:

- 1. Noise levels at other more distant dwellings are lower than the noise levels presented above, as a result of greater distance from the Subject Development
- 2. Noise sources and activities per Section 6.3.1
- 3. Noise character adjustments for tonality and impulsiveness for identified items of equipment detailed in Table 5.

As shown, the proposed operations are predicted to comply with EPA 1826-P1 noise limits. The assessment provides two scenarios, with the **'Busy Day'** scenario as the worst case which assumes that all noise sources are operating simultaneously, while the **'4-Day'** scenario has been shown to be much quieter.

7 Conclusion

Renzo Tonin & Associates undertook an acoustic assessment of the proposed paint recovery plant to be located at 2-44 Grainger Road, West Footscray (the Subject Facility), to assess noise from commercial operations.

We have been briefed by Davis Advisory to consider acoustics in relation to the proposed Paint Circular Economy HQ (PaCE HQ) project in West Footscray. The PaCE HQ project is described in Annexure D of the application, and our comments and findings are referrable to that project.

In conducting the acoustic assessment, Renzo Tonin & Associates has:

- Quantified relevant noise criteria: EPA 1826-P1 'Noise Protocol'
- Measured noise levels from operational activities and associated mechanical equipment at similar industrial facilities
- Analysed the noise monitoring and measurements
- Constructed a three-dimensional noise model of the Subject Facility, to assess various noise impacts (described below)
- Assessed and compared predicted levels to noise limits.

The outcomes of the acoustic assessment are:

- Noise levels from the representative mechanical services were found to conform at all times with EPA 1826-P1 'Noise Protocol' limits.
- Noise levels from anticipated delivery activities were found to conform at all times with EPA 1826-P1 limits.
- Noise levels from the warehouse/plant operations were found to conform at all times with EPA 1826-P1 limits, with the specific construction requirements detailed in Section 6.3.1.2. The specific construction requirements include wall and ceiling treatments to the warehouse. Such treatments are commonplace, and application is straight forward to design, during the design stage when more detailed information is available.

Based on the above, the PaCE HQ project is expected to conform with all nominated criteria, and on this basis, not unreasonably affect noise amenity in the area.

APPENDIX A Glossary of terminology

The following is a brief description of the technical terms used to describe noise to assist in understanding the technical issues presented.

Air-borne noise		-	transmitted by way of the air and can be attenuated by the use of	
Ambient noise	<u> </u>		ically between the noise source and receiver. ssociated within a given environment at a given time, usually	
	composed of sound from all sources near and far.			
Assessment period	The time period in which an assessment is made. e.g. Day 7am-6pm.			
Assessment Point	A location at which	a noise or	vibration measurement is taken or estimated.	
Attenuation	The reduction in th	e level of so	ound or vibration.	
A-weighting	A filter applied to t human ear.	he sound re	ecording made by a microphone to approximate the response of the	
Background noise	noise, measured in the minimum noise A-weighted noise	the absence levels mea evel exceed leasured as	used to describe the underlying level of noise present in the ambient se of the noise under investigation. It is described as the average of sured on a sound level meter and is measured statistically as the led for ninety percent of a sample period. This is represented as the an overall level or an L ₉₀ noise level when measured in octave or	
Barrier (Noise)			cal barrier which impedes the propagation of sound and includes berms and buildings.	
Berm	Earth or overburde	n mound.		
Buffer	An area of land between a source and a noise-sensitive receiver and may be an open space or a noise-tolerant land use.			
Bund	A bund is an embankment or wall of brick, stone, concrete or other impervious material, which may form part or all of the perimeter of a compound.			
Decibel [dB]	The units that sound is measured in. The following are examples of the decibel readings of common sounds in our environment:			
	threshold of	0 dB	The faintest sound we can hear, defined as 20 micro Pascal	
	tili Caliola Oi			
	hearing	10 dB	Human breathing	
	hearing	10 dB 20 dB		
	hearing almost silent	20 dB	Human breathing	
	hearing	20 dB 30 dB	Human breathing Quiet bedroom or in a quiet national park location	
	almost silent generally quiet	20 dB 30 dB 40 dB	Human breathing Quiet bedroom or in a quiet national park location Library	
	hearing almost silent	20 dB 30 dB 40 dB 50 dB	Human breathing Quiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night	
	almost silent generally quiet moderately loud	20 dB 30 dB 40 dB 50 dB	Human breathing Quiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night CBD mall at lunch time	
	almost silent generally quiet	20 dB 30 dB 40 dB 50 dB 60 dB 70 dB	Human breathing Quiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night CBD mall at lunch time The sound of a car passing on the street	
	almost silent generally quiet moderately loud	20 dB 30 dB 40 dB 50 dB 60 dB 70 dB 80 dB	Human breathing Quiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night CBD mall at lunch time The sound of a car passing on the street Loud music played at home	
	almost silent generally quiet moderately loud	20 dB 30 dB 40 dB 50 dB 60 dB 70 dB 80 dB 90 dB	Authorized Human breathing Quiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night CBD mall at lunch time The sound of a car passing on the street Loud music played at home The sound of a truck passing on the street	
	almost silent generally quiet moderately loud	20 dB 30 dB 40 dB 50 dB 60 dB 70 dB 80 dB 90 dB	Human breathing Quiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night CBD mall at lunch time The sound of a car passing on the street Loud music played at home The sound of a truck passing on the street Indoor rock band concert	
	almost silent generally quiet moderately loud loud very loud	20 dB 30 dB 40 dB 50 dB 60 dB 70 dB 80 dB 90 dB 100 dB	Audiet bedroom or in a quiet national park location Library Typical office space or ambience in the city at night CBD mall at lunch time The sound of a car passing on the street Loud music played at home The sound of a truck passing on the street Indoor rock band concert Operating a chainsaw or jackhammer	

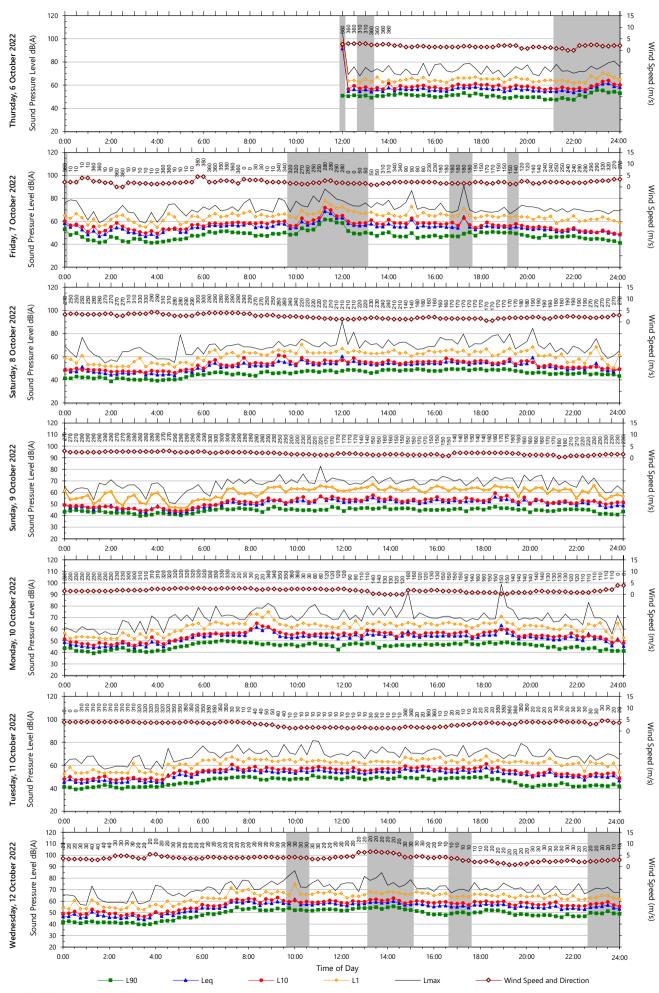

dB(A)	A-weighted decibel. The A- weighting noise filter simulates the response of the human ear at relatively low levels, where the ear is not as effective in hearing low frequency sounds as it is in hearing high frequency sounds. That is, low frequency sounds of the same dB level are not heard as loud as high frequency sounds. The sound level meter replicates the human response of the ear by using an electronic filter which is called the "A" filter. A sound level measured with this filter is denoted as dB(A). Practically all noise is measured using the A filter.
dB(C)	C-weighted decibels. The C-weighting noise filter simulates the response of the human ear at relatively high levels, where the human ear is nearly equally effective at hearing from mid-low frequency (63Hz) to mid-high frequency (4kHz), but is less effective outside these frequencies. The dB(C) level is not widely used but has some applications.
Diffraction	The distortion of sound waves caused when passing tangentially around solid objects.
EPA	Environment Protection Authority
Flanking	Flanking is the transfer of sound through paths around a building element rather than through the building element material directly.
	For example, sound travelling through a gap underneath a door or a gap at the top of a wall.
Fluctuating Noise	Noise that varies continuously to an appreciable extent over the period of observation.
Free-field	An environment in which there are no acoustic reflective surfaces. Free field noise measurements are carried out outdoors at least 3.5m from any acoustic reflecting structures other than the ground.
Frequency	Frequency is synonymous to pitch. Sounds have a pitch which is peculiar to the nature of the sound generator. For example, the sound of a tiny bell has a high pitch and the sound of a bass drum has a low pitch. Frequency or pitch can be measured on a scale in units of Hertz or Hz.
Heavy Vehicle	A truck, transporter or other vehicle with a gross weight above a specified level (for example: over 8 tonnes).
Impulsive noise	Having a high peak of short duration or a sequence of such peaks. A sequence of impulses in rapid succession is termed repetitive impulsive noise.
Intermittent noise	The level suddenly drops to that of the background noise several times during the period of observation. The time during which the noise remains at levels different from that of the ambient is one second or more.
L ₁	The sound pressure level that is exceeded for 1% of the time for which the given sound is measured.
L ₁₀	The sound pressure level that is exceeded for 10% of the time for which the given sound is measured.
L ₉₀	The level of noise exceeded for 90% of the time. The bottom 10% of the sample is the L_{90} noise level expressed in units of dB(A).
L _{Aeq} or L _{eq}	The "equivalent noise level" is the summation of noise events and integrated over a selected period of time, which would produce the same energy as a fluctuating sound level. When A-weighted, this is written as the L _{Aeq} .
L _{max}	The maximum sound pressure level measured over a given period. When A-weighted, this is usually written as the $L_{\text{Amax.}}$
L _{min}	The minimum sound pressure level measured over a given period. When A-weighted, this is usually written as the L_{Amin} .
Loudness	A rise of 10 dB in sound level corresponds approximately to a doubling of subjective loudness. That is, a sound of 85 dB is twice as loud as a sound of 75 dB which is twice as loud as a sound of 65 dB and so on. That is, the sound of 85 dB is four times or 400% the loudness of a sound of 65 dB.
Noise	Unwanted sound
Reflection	Sound wave reflected from a solid object obscuring its path.

R _w	Weighted Sound Reduction Index
	A measure of the sound insulation performance of a building element. It is measured in very controlled conditions in a laboratory. The term supersedes the value STC which was used in older versions of the Building Code of Australia. R_w is measured and calculated using the procedure in ISO 717-1. The related field measurement is the $D_{nT,w}$.
	The higher the value the better the acoustic performance of the building element.
R_{w}	Weighted Apparent Sound Reduction Index.
	As for $R_{\rm w}$ but measured in-situ and therefore subject to the inherent accuracies involved in such a measurement.
	The higher the value the better the acoustic performance of the building element.
SEL	Sound Exposure Level (SEL) is the constant sound level which, if maintained for a period of 1 second would have the same acoustic energy as the measured noise event. SEL noise measurements are useful as they can be converted to obtain $L_{\rm eq}$ sound levels over any period of time and can be used for predicting noise at various locations.
Sound absorption	The ability of a material to absorb sound energy by conversion to thermal energy.
Sound level meter	An instrument consisting of a microphone, amplifier and indicating device, having a declared performance and designed to measure sound pressure levels.
Sound power level	Ten times the logarithm to the base 10 of the ratio of the sound power of the source to the reference sound power of 1 pico watt.
Sound pressure level	The level of noise, usually expressed in decibels, as measured by a standard sound level meter with a microphone referenced to 20 mico Pascal.
Tonal Noise	Sound containing a prominent frequency and characterised by a definite pitch.

APPENDIX B Noise monitoring

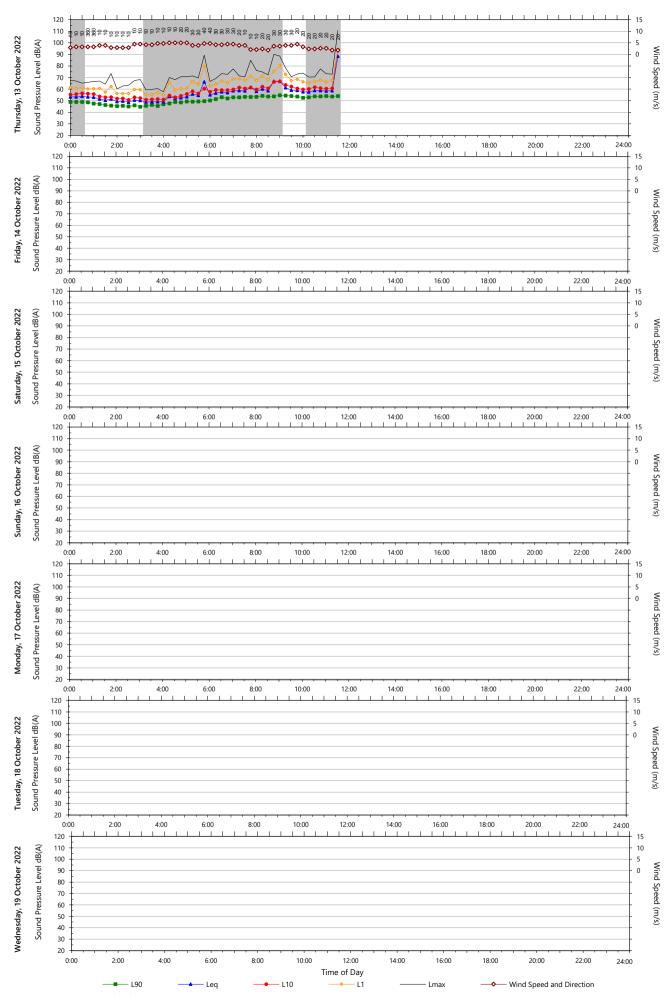

B.1 L1 – 1 Robbs Road Resident's front yard

Greyed out periods in noise monitoring charts correspond to times of precipitation or excessive wind, referenced from Bureau of Meteorology Laverton RAAF Weather Station.
